Initial CR / Bug Fix Description

A defect was identified where the bot copied the 2024 Planning.xlsx file from SharePoint to a OneDrive for Business folder, but the file remained in a filtered state post-copy. This prevented the bot from reliably accessing all required data, particularly the row corresponding to the current date (Today's date).

To resolve the issue, the automation was enhanced to explicitly remove all filters from the Excel worksheet after copying. This ensures full visibility of the dataset and enables the bot to correctly locate and process the row corresponding to the current date.

Release Log

<Version>

Code changes:

1. Get the original Excel file using the Get file Content action in power to automate use for SharePoint location.
2. Need to copy the original Excel file in OneDrive for Business using the Create file action in Power Automate.
3. Developed the automated Run script in Excel to perform the unfiltered rows & columns.

Document changes:

Changes will be made to the SDD to reflect the new logic from this release.
